this book takes a pedagogical approach to explaining quantum gravity supersymmetry and string theory in a coherent way it is aimed at graduate students and researchers in quantum field theory and high energy physics the first part of the book introduces quantum gravity without requiring previous knowledge of general relativity gr the necessary geometrical aspects are derived afresh leading to explicit general lagrangians for gravity including that of general relativity the quantum aspect of gravitation as described by the graviton is introduced and perturbative quantum gr is discussed the schwinger dewitt formalism is developed to compute the one loop contribution to the theory and renormalizability aspects of the perturbative theory are also discussed this follows by introducing only the very basics of a non perturbative background independent formulation of quantum gravity referred to as loop quantum gravity which gives rise to a quantization of space in the second part the author introduces supersymmetry and its consequences the generation of superfields is represented in detail supersymmetric generalizations of maxwell s theory as well as of yang mills field theory and of the standard model are worked out spontaneous symmetry breaking improvement of the divergence problem in supersymmetric field theory and its role in the hierarchy problem are covered the unification of the fundamental constants in a supersymmetric version of the standard model are then studied geometrical aspects necessary to study supergravity are developed culminating in the derivation of its full action the third part

introduces string theory and the analysis of the spectra of the mass squared operator associated with the oscillating strings the properties of the underlying fields associated with massless particles encountered in string theory are studied in some detail elements of compactification duality and d branes are given as well of the generation of vertices and interactions of strings in the final sections the author shows how to recover gr and the yang mills field theory from string theory

the proceedings reflect a broad spectrum of topics in contemporary theoretical physics quantum aspects of black holes recent progress in critical and noncritical string theory spin chains quantum hall effect and generalized statistics stochastic dynamics turbulence and reaction kinetics foundations of quantum mechanics new statistics in field theory quantum field theory on riemann surfaces and knot theory lattice field theories the lectures present developments in the frontiers of these subjects and provide interdisciplinary links between the areas
