this report presents the methodology and main findings of an assessment conducted between 2015 and 2020 to identify the primary drivers of deforestation and forest degradation in west africa developed under the project global transformation of forests for people and climate this assessment supports regional forest governance by providing robust participatory and data driven insights combining a systematic literature review with spatial analysis using high resolution satellite imagery and open source tools such as sepal and collect earth the methodology enabled the identification of changes in land use and forest cover across 64 000 sample plots national experts from west african countries contributed to the prioritization and interpretation of drivers ensuring local relevance and ownership the results reveal that small scale agriculture logging and fire are the predominant drivers of forest change often occurring in combination within the same plot these findings highlight the complexity of deforestation and degradation processes and underscore the need for integrated responses the study also maps the spatial distribution of drivers across countries and provides recommendations for national adaptation of the methodology policy integration and community engagement this assessment offers a replicable framework for understanding forest loss in west africa and sets the stage for more targeted science based forest monitoring and management at both national and regional levels

p bolivia s forest resources are of global importance its main forest areas are located in subtropical and tropical regions there is severe deforestation going on in the lowlands at a rate of approximately 200 000 ha per year whilst forest degradation mostly concerns montane forests cattle ranching is the most important direct driver of deforestation followed by mechanized agriculture at medium and large scale level mainly for the production of soy bean and finally small scale agriculture underlying causes of deforestation include among others the opening of the agricultural economy to international markets and the weakness of institutions in charge of controlling land use from

2006 on under the government of evo morales bolivia adopted an official position against the marketization of nature and in defense of the rights of mother earth in consequence to its rejection of redd bolivia developed an alternative proposal called joint mechanism of mitigation and adaptation for integrated and sustainable management of forests and mother earth this proposal was also promoted in international negotiations on climate change it focuses on local experiences for a sustainable and integrated management of natural resources and fosters land use planning at different levels of governance our analysis suggests that there is still a lack of concrete approaches to mitigate the direct threats to forests moreover the control of illegal deforestation is still insufficient we also note that in parallel to policies of nature conservation there is a contradicting political agenda being implemented promoting the expansion of the agricultural frontier only the future will show if the vision of living well in harmony with mother earth will really lead to effective measures to combat the loss and the degradation of the immense richness of bolivian forest p

deforestation and climate change provides a comprehensive overview of the state of play in international regimes programs and proposals for reducing emissions from deforestation and forest degradation the book brings together a collection of papers canvassing some very important topics cleverly crafted by the editors to flow rationally from general observations to quite technical evaluation of methods and approaches it caters for a range of audiences who may have a little knowledge of climate change policy development matt mcintyre
australian journal of environmental management

in this infobrief we outline the rules and choices to be addressed by participatory countries in redd activities and show some technical problems they can face and some options they can adopt

the growth in the human population has forced mankind to convert forested land into other land uses such as agricultural land residential urban road construction and mining activities the degradation of forest due to anthropogenic activities is significantly reducing forests in

the world these practices result in significant impacts on the forest structure species composition and ecology which will consequently reduce forest productivity and ecosystem functions due to deforestation half of the earth's vegetation surface has reduced to one third resulting in large degraded areas the significant reduction of the forest areas requires appropriate planning for sustainable management of the forests this book reviews the extent and consequences of deforestation around the world it highlights case studies of the causes of deforestation in malaysia korea india bangladesh columbia brazil and mali it is hoped that the book will provide insights on the importance of effective forest planning and management for the sustainable development of forest resources

the world's forests are disappearing at an alarming rate and with disastrous consequences demand for wood and paper products ranks high amongst the causes of deforestation and forest degradation and is now the major cause of loss in those forests richest in wildlife there is a great deal to be done to improve the timber industry before our forests are safely and sustainably managed bad harvest presents an incisive account of the role that the timber trade has played in the loss and degradation of forests around the world it examines the environmental consequences of the trade on boreal temperate and tropical regions and its impacts for local people working and living in the forests it also looks at the changing nature of the trade and assesses current national and international initiatives to address the impacts of deforestation finally the authors show how things could be improved in the future by presenting a new strategy for sustainable forest management based on 15 years of extensive research particularly work carried out by the world wide fund for nature bad harvest is essential reading on the subject not only for environmentalists but also for those in the timber trade seeking to improve the management and reputation of their product

this report explores the drivers both direct and indirect of deforestation and forest degradation and discusses the political economic and social opportunities and constraints that will influence the design and implementation of redd in laos the government of laos has long sought to curb deforestation and forest degradation and the country is receiving considerable international attention and support to

implement redd however agricultural expansion the development of industrial tree plantations and large hydropower mining and infrastructure projects continue to result in deforestation with shifting cultivation and selective logging legal and illegal largely blamed for forest degradation at the same time indirect drivers of deforestation and forest degradation are rooted in a national agenda of economic growth characterized by incentives for foreign and domestic investment in forest management and timber harvesting as a result laos is becoming an important resource frontier for transnational capital and large scale land and natural resource investments the consequent intensification of competition for resources poses a challenge not only for forest governance but also for the development of redd policies and initiatives in an examination of the institutions and policies defining laos forestry sector and redd the report reflects on lessons to be learned from past forestry and economic development policies the government of laos has demonstrated strong political interest in redd but redd implementation faces major obstacles particularly unclear carbon rights and weak governance with the latter attributable to poor local capacity weak coordination among stakeholders and minimal involvement by local communities and civil society the report makes several recommendations for achieving effective efficient and equitable outcomes of redd in laos capacity building of administrative and technical staff especially at the subnational level clarification and harmonization of land use planning and land allocation processes and stronger monitoring and law enforcement in areas under high threat of deforestation and forest degradation furthermore an accountable and transparent mechanism for sharing the benefits of redd across levels and fully accountable consultation processes must be implemented with the participation of not only elite and powerful actors such as domestic and foreign businesses but also local groups and civil society

a search for new methods for dealing with climate change led to the identification of forest maintenance as a potential policy option that could cost effectively reduce greenhouse gas emissions with the development of measures for reducing emissions from deforestation and forest degradation redd this book explores how an analysis of past forest governance patterns from the global through to the local level

can help us to build institutions which more effectively deal with forests within the climate change regime the book assesses the options for reducing emissions from deforestation in developing countries under the international climate regime as well as the incentives flowing from them at the national and sub national level and examines how these policy levers change human behaviour and interface with the drivers and pressures of land use change in tropical forests the book considers the trade offs between certain forestry related policies within the current climate regime and the larger goal of sustainable forestry based on an assessment of existing multi level institutional forestry arrangements the book questions how policy frameworks can be better designed in order to effectively and equitably govern the challenges of deforestation and land degradation under the global climate change regime this book will be of particular interest to students and scholars of law and environmental studies

reducing emissions from deforestation and forest degradation redd attempts to address climate change from one angle by paying developing countries to slow or stop deforestation and forest degradation trumpeted as a way to both mitigate climate change and assist countries with development redd was presented as a win win solution however there have been few attempts to understand and analyse the overall framework why redd will fail argues that the important goals will not be met under the existing redd regime unless the actual drivers of deforestation and forest degradation are diminished the book delves into the problematic details of the regime ranging from national capacity to monitor results the funding mechanism the definition of a forest leakage and the impetus behind the drivers of deforestation and forest degradation as the international community rallies around redd and developed countries and companies are willing to commit substantial amounts to implement the scheme this books seeks to address whether redd has the potential to achieve its purported goals this is an important resource for academics and students interested in the policy and management aspects of mitigating climate change environmental policy international relations and development studies as well as policy makers involved in the redd process

deforestation and forest degradation represent a significant fraction of the annual worldwide human induced emission of greenhouse gases to the atmosphere the main source of biodiversity losses and the destruction of millions of people s homes despite local regional causes its consequences are global this book provides a general view about deforestation dynamics around the world incorporating analyses of its causes impacts and actions to prevent it its 17 chapters organized in three sections refer to deforestation impacts on climate soil biodiversity and human population but also describe several initiatives to prevent it a special emphasis is given to different remote sensing and mapping techniques that could be used as a source for decision makers and society to promote forest conservation and control deforestation

given that widespread degradation of tropical forests causes the release of similar amounts of greenhouse gases as deforestation managed forests could mitigate global warming while contributing to sustainable development unfortunately in the international debates leading up to a post kyoto climate change agreement the focus continues to be almost entirely on deforestation worse yet unless safeguards are in place continued use of the kyoto protocol s definition of forest could inadvertently accelerate forest degradation in developing countries putting the ecosystem functioning and the continuous flow of ecosystem services at risk this report motivates the need for a new definition of forest and for inclusion of forest degradation in the new global climate change convention
